

M18.3 Solution Guide - Splunk Warm Up

In this activity, you designed a custom SPL query and researched specific security mitigation strategies for an attack.

1. Upload the provided log file.
2. Determine the top source IP address (`src_ip`).
 - The top `src_ip`, with a count of 22, is 41.146.8.66.
3. Determine the primary attack name (`attack_name`) in the logs.
 - The top, and only, `attack_name` is `Oracle.9i.TNS.OneByte.DoS`.
4. Answer the following questions:
 - Fortinet logs are from which type of device?
 - These logs are from an intrusion prevention system. The vendor's name is Fortinet.
 - What is the city and country of the top source IP address?
 - Using any online geo-lookup tool, we can learn that the IP is from Pretoria, South Africa.
 - Provide a brief summary of the `attack_name` found:
 - According to the [Fortiguard website](#), this attack is a Denial of Service attack against a TNS listener. A TNS listener manages the traffic for a database.
 - What is a recommended mitigation for the attack?
 - According to the same website, one mitigation is to apply patching or upgrade to a non-vulnerable version.
