

Module 19 Day 1: Geographic Map Visualization

- OMP would like you to expand the visualizations to provide more geographic information on the attacks.
- The security team can use this information to create firewall rules that restrict traffic from certain geographic locations.
- Design a geographic map visualization to help the SOC team understand where attacks originated.

Instructions

1. Design a geographic map that displays a visualization of source IP address locations. Use the following fields:
 - `source="radialgauge.csv"`
 - `http_method=POST`
2. Hint: Add `iplocation` and `geostats` to the query.
3. Save the visualization as a report titled "Geographic Map – POST request monitor by Source IP."

Bonus

Modify the search to display the URIs attacked in the same map.

- Hint: Research how to modify the `geostats` command.
