

M19.1 Solution Guide - Geographic Map Visualization

In this activity, you designed a geographic map using the `iplocation` and `geostats` commands.

1. Design a geographic map that displays a visualization of source IP address locations.
 - `source="radialgauge.csv" http_method=POST| iplocation src_ip | geostats count`
 - In the Visualization tab, select the cluster map visualization type.
2. Save the visualization as a report titled "Geographic Map – POST request monitor by Source IP."

Bonus

Modify the search to display the URIs attacked in the same map:

- `source="radialgauge.csv" http_method=POST| iplocation src_ip | geostats count by uri_path`
