

M19.1 Solution Guide - Single-Value Visualization

In this activity, you were tasked with designing a radial gauge to illustrate the severity of a single value.

1. Upload the radialgauge.csv file to your local Splunk system located in the splunk/logs/Week-2-Day-1-Logs directory. Select all defaults during the upload process.
2. Design a search to view the POST events:
 - `source="radialgauge.csv" http_method=POST |stats count as total`
3. Design a radial gauge to visualize the data.
 - Select Visualization > Radial Gauge.
 - Change the ranges of the radial gauge by selecting Format > Color Ranges > Manual.
 - The ranges can vary, as long as 1,200 POST requests per hour is in the red range. For example:
 - Green: 0–400
 - Yellow: 400–1,000
 - Red: 1,000–2,000
4. Save your visualization as a report titled "Radial Gauge – POST request monitor."

Once you save, the radial gauge should display.

Bonus

Design an alert to trigger when the count reaches the red range.

- This will vary depending on the ranges selected.
- The bonus is correct if an alert is designed to trigger when the number of events reaches the lower part of the red range selected in Step 3.
