

Module 21 Day 1: Analyzing Ransomware with ANY.RUN

In today's final activity, you will play the role of an incident responder tasked with analyzing malware that infected a user's computer at your organization.

- You are tasked with safely analyzing the provided malware and completing a report about the impact on your organization.

Instructions

- Open the following ransomware on ANY.RUN:
 - [Wannacry Ransomware](#)
- Following the same process as the class demonstration, use ANY.RUN UI to answer the following questions:

Pane 1: Desktop VM

- What appears on the user's desktop as the malware runs?
- How much is the user asked to pay? How are they expected to pay?
- How much time does the user have until the amount increases?
- How much time does the user have until their files are lost?

Pane 2: Details

- How many network connections do you see?
 - What countries are they from?
 - What are the ports/protocols?
- How many files were modified?
- How many threats were identified?
 - What is the name of the process identified as a threat?

Pane 3: Metadata

- What is the MD5 hash of the ransomware?
- What is the OS this malware was run on?

- What are the mitre techniques and tactics used by this malware?
 - Just document 3–4 of them.

Pane 4 - Processes

- View the wannacry executable process, and select “more info”
- What is the score and verdict of this process?
- What username did the process run as?
- What are the steps the ransomware is executing? (Hint: view the right side of this page).
