

Module 3 Day 2 Activity File: Learn New Commands

- In this activity, you will continue in your role as a security analyst at Candy Corp.
- Candy Corp has recently experienced a network attack on its websites. It needs your help determining which Candy website was the main target of the attack.
- Your manager provides you with log files for each of Candy Corp's websites.
- Each log file contains the IP addresses that connected to each website on the day of the attack.
- You are tasked with counting the IP addresses in each file to determine which Candy website was the main target of the attack.

Instructions

Using only the command line, complete the following tasks from within the `/03-student/day2/learning_new_commands/` folder in your Ubuntu virtual machine:

1. There are log files for each website within this directory. Each log file contains a list of IP addresses.
 - Each line represents an hour.
 - Each line includes the IP addresses that connected to the website during that hour.
2. Using man pages, research how to use the `wc` command to count the total number of IP addresses in each file.
Hint: There is more than one IP address on each line, so the line-count command will not work.
3. Run the command to determine which website had the most network connections and was, therefore, the likely target of the attack.

Bonus

- Use redirection with the new command to place the total number of IP addresses for each file into a file called `Connections_by_website`.
Hint: Use a wildcard, such as `*`, to run this with a single command.
