

Solution Guide: Warm-up

- The first step is to navigate into the `/03-student/day2/warmup/` folder on our virtual machines. To do this, run the following command:
 - `cd /03-student/day2/warmup/`
- Next, confirm which directories are in this folder by running `ls`. This will display the following three directories:
 - `physical_access_logs/`
 - `server_logs/`
 - `web_logs/`
- The next step is to create a directory called `additional_evidence`. Run the following command:
 - `mkdir additional_evidence`
- We have been tasked with viewing the `physical_access_logs`. To navigate into this directory, run the following:
 - `cd physical_access_logs/`
- This folder contains six physical access logs. To view the contents, run preview commands (`head`, `more`, or `less`) to find out which contain the data for October 13, 2019. For example, you could run the following:
 - `head physical1`
- After viewing all the files, we determine that the two files containing logs for that date are `physical4` and `physical5`. We need to combine these two files into a single file called `Physical_Access_evidence`.
To do this, run the `cat` command:
 - `cat physical4 physical5 > Physical_Access_evidence`
- We can run the `ls` command again to show that the file has been created.
- Lastly, we need to move this new file to the `additional_evidence` folder. We do this using absolute paths:
 - `mv /03-student/day2/warmup/physical_access_logs/Physical_Access_evidence /03-student/day2/warmup/additional_evidence`
