

Solution Guide: grep

- The first step is to navigate into the folder on our virtual machines where the recipes are located. To do this, run the following commands:
 - `cd /03-student/day2/`
 - `cd finding_your_way/`
 - `cd PeanutButtery.net/other/disregard/candysecretrecipes`
- We need to search for recipes containing the ingredient "guavaberries." The command to search for them in this directory is as follows:
 - `grep -i guavaberries *`
 - Note the syntax:
 - `grep` is the command being run.
 - `-i` is the option for `grep` that indicates case insensitivity.
 - `guavaberries` is the specific data point being searched for.
 - `*` is a wildcard, indicating the command should search through all files in the current directory.
- After running the command, the results show the following four files contain "guavaberries":
 - `recipe_crunchybars:5 guavaberries`
 - `recipe_peanutballs:4 guavaberries`
 - `recipe_peanutsquares:8 guavaberries`
 - `recipe_yumbars:2 guavaberries`
- These results show the file names of all recipes that include guavaberry as an ingredient, followed by a colon and the line in which "guavaberries" appears.

Bonus

- Adjust the `grep` command to search for files that also contain the word "optional," indicating that the guavaberries are an optional ingredient.
The command to search for multiple data points in a file is:
 - `grep -i 'guavaberries\|optional' *`
 - Note the syntax:
 - `grep` is the command being run.
 - `-i` is the option for `grep` that indicates case insensitivity.
 - `guavaberries` is the first specific data point being searched for
 - `\|` Indicates OR.
 - It is included between values to search for multiple values using one command.
 - `optional` is the second data point being searched for.

- * is a wildcard indicating the command should search through all files in the current directory.
- Run the command, and notice that the results show all four files, but five lines contain "guavaberries" OR "optional":

Unset

```
recipe_crunchybars:5 guavaberries
```

```
recipe_peanutballs:4 guavaberries
```

```
recipe_peanutsquares:8 guavaberries
```

```
recipe_peanutsquares: Note: optional - another berry that can be  
substituted is blueberries
```

```
recipe_yumbars:2 guavaberries
```

- This shows that `recipe_peanutsquares` has an "optional" note stating that blueberries can be used in place of guavaberries.
- This shows that Candy Corp should be the most concerned about the peanut squares recipe, as Sugar can make it without guavaberries.
