

Module 6 Day 1: Creating Aliases

In the previous activity, you created longer commands by combining commands to save time. Now, we will take things a step further and create some aliases for these commands along with some other commands that will save you more time when working at the command line.

- In this activity, you will create several aliases and save them to your `~/ .bashrc` file so that they will always be available.
- When completing this activity and creating aliases, consider the following:
 - Start by ensuring that each part of your command works correctly.
 - Ensure that the entire command works before creating the alias.
 - Use `nano` to edit `~/ .bashrc`, or use `echo` to echo your new alias into the `~/ .bashrc` file.

Remember: If you get an error, check the file. Sometimes errors don't mean something is broken—they may just be informative messages that explain why a certain file was not included.

Instructions

Create aliases in your `~/ .bashrc` file for the following commands:

- `ls -a`
- `cd ~/Documents`
- `cd ~/Downloads`
- `cd /etc`

Bonus Aliases

- `nano ~/ .bashrc`
- `mkdir ~/research && cp /var/log/* /etc/passwd /etc/shadow /etc/hosts ~/research`

Note: Remember to reload your `~/ .bashrc` file before trying out your new aliases.
