

Activity File: Creating Users and Setting Password Policies

In the previous activity, you used the `net` command-line tool to find various types of information.

- Your CIO noticed the previous password policies were not very strict and wants to enforce new password policies on this Windows workstation for the next two new users: senior developer Andrew and sales representative Bob.
- You are tasked with creating a regular user, `Bob`, and an administrative user, `Andrew`, and setting the password policies with the following parameters:
 - Maximum password age is 90 days.
 - Minimum password length is 12 characters.
 - Password complexity requirements are enabled.

Continue using the Windows RDP host machine.

Instructions:

1. Create a regular user, `Bob`, using the `net user` command-line tool.
2. Set the user's password to `Illovesales123!`. They will change this on their first day.
 - Note that you can use `net user [username] *` to change the password of an existing user (if you added the user without setting the password, or set it improperly).

3. Create a user, **Andrew**, and add them to the **Administrators** group.
4. Set the user's password to **Illovedevelopment123!**. They will change this on their first day.
5. Use **net** to verify that Andrew is in the **Administrators** group.
6. Launch **gpedit** and set the following password policies for the entire Windows machine:
 - Maximum password age is 90 days.
 - Minimum password length is 12 characters.
 - Password complexity requirements are enabled.
