

Activity File: Intro to Task Manager and CMD

In this activity, you will play the role of a junior system administrator at Good Corp, Inc.

- Throughout the day, you will be working on a report about this Windows machine. You will start the report in this activity.
- A senior software developer who recently left the company left behind a Windows workstation that was never centrally managed by IT.
- Your CIO has requested that you do the following on the Windows workstation:
 - Use Task Manager to clean up running and startup processes.
 - Use CMD to create a simple text file in the `%USERPROFILE%\Desktop` directory called `report.txt` and begin appending Windows system information to it.

Make sure you're logged in to the **Windows RDP host machine** with the following credentials:

- Username: `azadmin`
- Password: `p@ssw0rdp@ssw0rd`

Instructions

1. Use Task Manager to end the following processes (tasks) if they are running:

- Apple Push
- iCloud Services
- iPod Service
- iTunesHelper
- Skype
- Apple Push
- TeamViewer

Note: There may be multiples of these tasks, such as the Skype instances.

2. Use Task Manager to disable all startup processes, except for the following:

- Microsoft OneDrive
- Windows Security notification icon

3. Using the Windows command line, create a **reports** folder on the user's desktop where you'll store your findings.

- **Note:** You'll likely want to save all of your working commands to a text file for reference. This way, if you make a mistake in your report, you can delete it easily and re-run the working commands.

4. Print a line that reads **Baselining Report** and output it to a new **report.txt** file. This will create a title within your report.

5. Print another line titled **Created by [your name here]** and append it to the file.

6. Use the ENV variables in the command line to add the following:

- Add the OS, date, and user to the report using the command line. Use the following format and refer to the reference table below:
- [operating system] system report created on [today's date] with logged in user, [current username]

Environment Variable	Default Value
%CD%	Current directory
%DATE%	Current date
%OS%	Windows
%ProgramFiles%	C:\Program Files
%ProgramFiles(x86)%	C:\Program Files (x86)
%TIME%	Current time
%USERPROFILE%	C:\Users\{username}
%SYSTEMDRIVE%	C:
%SYSTEMROOT%	C:\Windows

Bonus

1. Using the ENV variables %ProgramFiles% and %ProgramFiles(x86)%, list the contents of these directories and append them to the report.
