

Activity File: DNS Hijacking

In this activity, you will continue to play the role of a security analyst at Acme Corp.

- In the previous activity, you determined that the hacker is trying to access Acme Corp's trade secrets.
- Acme Corp is concerned the hacker may try to access a website called `acmetradesecrets.com`. Acme must prevent the hacker from accessing this website.
- Your task is to create and test out a DNS spoof record that will redirect any hacker trying to visit `acmetradesecrets.org` to another website.
- This will first be tested on your machine, but later it will be added to the hacker's computer.

Instructions

Log into your Linux server.

1. Create a DNS spoof record for `acmetradesecrets.org` to be redirected to the IP address of `45.33.32.156` (`scanme.nmap.org`).
2. Open a browser in your Linux server and validate that when you access `acmetradesecrets.com`, it redirects correctly.

Bonus

- Research how to apply the same DNS spoof record on a Windows machine or VM.
- If you don't have access to a Windows machine, simply document the steps to create a DNS spoof record on a Windows system. If you have access to a Windows machine, apply the spoof record on it.
