

Activity File: Using curl

In this activity, you will continue in your role as a web application security engineer.

- You are tasked with writing various `curl` commands to interact with an HTTP web server.
- You will use various `curl` options, request methods, and request headers to return specific responses.

Use the [curl Reference Sheet](#) as a reference for your activity.

Instructions

Use `curl` commands to send HTTP requests to the site `httpbin.org`.

After constructing and testing each `curl` command, answer the questions that follow.

1. Send a GET request.
 - Run a GET request to `httpbin.org/anything`.
 - What is returned by this request? Is there anything that identifies the requester?
2. Retrieve response headers.
 - Run a GET request to `httpbin.org` with an added `curl` argument to display response headers.
 - What is the content type for this page?
3. Retrieve new response headers.
 - Run a GET request to `httpbin.org/anything` with an added `curl` argument to display response headers.

- What is the content type for this page?
4. Send a POST request.
- Run a POST request that enters `'{"Developer": "Andrew"}'` for the data argument.
 - Under what JSON object does the posted data appear?
5. Set parameters.
- Run a POST request with the added parameters `?EmployeeDirectory=frontend`.
 - After the parameters go through, where do they appear in the JSON response body?
6. Set headers.
- Run the same POST from Step 4 with an added header: `-H "Content-Type: application/json"`.
 - Where does the request body data end up?
