

Module 2 Day 3: Activity 1 Analyzing APTs with AI

Activity Introduction

- Cybersecurity professionals are constantly monitoring news services to identify new cyber threats. Detailed information is available from several sources, but AI can be used to quickly summarize critical information to determine if an organization is at risk and how.

Activity

The [Att&ck Mitre Page](https://attack.mitre.org/groups/) identifies over 100 APT groups in operation. Your group is tasked with identifying at least 5 groups that are targeting financial organizations.

- In ChatGPT, run the following prompt: “scan the mitre page at <https://attack.mitre.org/groups/> and identify 5 APT threats targeting financial organizations”

ChatGPT will analyze all of the APT groups and provide five specific to your organization.

- Choose one of the APTs identified and run the following prompt in the same ChatGPT window: “summarize [GROUP_NAME]”

Compare the summary to the Mitre page for the same group.

- To get additional information, use the prompt: “Expand and summarize the TTPs used by [GROUP_NAME]”

As a group, create a short summary of the group you chose and how they work.

Be prepared to report out to the class.

BONUS: Once you have chosen a group, do some online research and determine any recent cyberattacks by the group.
