

Module 2 Day 3: Activity 2 Generating Exploits with AI

Activity Introduction

- Cybersecurity penetration testers are often tasked with searching for vulnerabilities in a network and exploiting those vulnerabilities. Generating exploits can be challenging, but AI can provide a starting point for those exploits.

Activity

- Start by going to [Mitre's CVE Search page](#).
- Search for potential vulnerabilities. Hint - Think like a hacker and look around at potential vulnerabilities in your own network:
 - Windows 10
 - HP Printer
 - Ubuntu Linux
 - Apple Watch
- Remember that the first set of numbers in a CVE report is the year it was documented, so older vulnerabilities may be patched already.
- Choose an interesting vulnerability and go to ChatGPT with the prompt: "Summarize {CVE_NUMBER}."
- Ask ChatGPT to "Generate an exploit for {CVE_NUMBER}" and note that it is unlikely to provide the answer.
- Switch to [WhiteRabbitNeo](#) and use the same prompt and note the difference.
- Discuss with your group how you would use this information for testing.

Bonus

- Take advantage of AI's ability to summarize by copying the output from WhiteRabbitNeo into ChatGPT with the prompt: "Explain this like I am a complete newbie to cybersecurity" and note the results.
