

Activity File: Reviewing Cron

- As a junior administrator at Rezifp Pharma Inc., you have been using `tar` and `cron` to schedule user and system-wide jobs for maintenance and security tasks.
- A recently instated company-wide mandate is requiring that all IT staff take bi-monthly assessments based on their job's defined operational procedures. Today's assessment is based on `tar` and `cron`.

Instructions

1. Answer the following `cron` assessment questions:
 - When will the following `cron` schedules run?
 - `*/10 * * * *`
 - What event is the following `cron` a minute away from?
 - `59 23 31 12 *`
 - What do the following hypothetical `cron` likely do?
 - `0 22 * * 1-5 /home/Bob/Sales/sum_of_sales.sh`
 - `@weekly /home/sysadmin/Scripts/auto-update.sh`
2. Answer the following `script` assessment questions:
 - What is a shebang?
 - What two characters should come before the filename of a script?
 - Jane's script has user and group ownership of a script with `-rw-r--r--` permissions, but she cannot get it to run. What must she do to the file before it will run?
3. Answer the following `tar` assessment questions:
 - How does the `-x` option modify the `tar` command?
 - If a directory has `ten` files and the following command is used in it, how many files are being compressed?
 - `tar cvvWf backups/archive.tar .`
 - What option prints the full file specification of files as you interact with them?
 - Why is the `-f` option used in almost every `tar` operation?
4. **Bonus:** You are tasked to look through the `cron` jobs within your current workstation to see if any suspicious or modified cronjobs exist. Remove the one that matches the following descriptions:
 - `Cron` is running system-level jobs with `root` privileges.
 - The `cron` task you're looking for involves another machine.
