

### Activity File: Users, Groups, and Password Policies

In this activity, we will return to the command line to gather more information for our `report.txt` file.

- Your CIO is curious about the groups and password policies on the Windows workstation. You will continue retrieving information from this Windows workstation using the `net` command-line utility.

Continue using the nested Windows RDP host machine. Before continuing with your activities, remember to `cd` to the created `reports` directory.

**Note:** Continue saving your working commands into a text file for reference.

Instructions:

1. Enumerate users with `net user`.
2. Find the user `Alex`'s password status using `net` and append the output to your report.
3. Enumerate local groups with `net localgroup` and append the output to the report.
4. Enumerate the current password policy using `net accounts` and append the output to your report.
5. Check your updated report.
