

Activity File: Generating Windows Event Log Files with Parameters and Pipelines

In this activity, you will play the role of a Windows system administrator.

- You are tasked with creating and saving logs to the directory **C:\Logs**.
- These logs can then be sent to security analysts for examination in a Security Information and Event Management System (SIEM).

Continue to use the Windows RDP host machine for this activity.

Instructions

Your CIO has asked you to do the following in PowerShell:

1. Use **Get-WinEvent -listlog *** to show the list of available logs.
2. Check for, and retrieve, the names of the security and application logs.
3. For each of these logs, create a pipeline that:
 - Gets the latest 100 events.
 - Transforms the log to JSON.
 - Outputs the objects in the JSON file to the **C:\Logs** directory.

Hint: To complete this activity, you will need to use the `Get-WinEvent`, `ConvertTo-Json`, and `Out-File` cmdlets.

- At the end of this activity, the following files should be in `C:\Logs`:
 - RecentSecurityLogs.json
 - RecentApplicationLogs.json
- This means you'll need to run the PowerShell pipeline at least two times.
