

Activity File: Move and Create Directories

In this activity, you will work as a junior system administrator tasked with vetting a process to create Windows Event logs.

- These logs will later be integrated into a log management program known as a SIEM.
- Use your Windows RDP host machine for this activity.

Instructions

1. Since we will eventually decommission the **Alex** user, move the **contracts** folder from Alex's desktop directory to **C:**.
2. Create **Backups** and **Scripts** directories in **C:**.
 - Also create the **C:\Logs** directory if you did not do so earlier.
3. Check the contents of the **C:** directory to make sure the **Logs**, **Backups**, and **Scripts** directories exist.

Bonus

1. Use **Rename-Item** to capitalize the **contracts** directory if it is not already.
