

Module 18 Day 1: Rule Correlation

Activity Instructions

As the SOC manager at OMP, you have successfully normalized the various web server logs.

- Your manager would like you to make a plan for identifying an attack while it is occurring.
- Since you don't have a SIEM tool yet, your first task is to design a plainly worded outline of a correlation rule that will be used to identify an attack.
- Your correlation rule will later be translated to real code that will create alerts on your SIEM.

Instructions

Without using any code, design a rule that will assist with detecting the following security events:

1. There was suspicious and unsuccessful web activity from Beijing.
2. There were floods of web requests from a single-source IP in a short period of time.
3. There were suspicious successful web requests to access JPG images from IPs outside the US.
