

Module 18 Day 3: Baselining

Activity Instructions

- You have just been notified that one of your Windows servers experienced a brute-force attack on February 11, 2020.
- Fortunately, the attacker did not gain access to the server. However, your manager is concerned that this may happen again.
- You've been provided with the server's logs for the past several days.
- You are tasked with reviewing the logs and creating a baseline of normal hourly login counts.

Instructions

1. Upload the provided Windows log file: `windowsrawlogs.txt`.
2. Design a search to look at failed logins, which is represented by EventCode 4625.
3. Determine when the attack happened.
4. Determine the approximate average of normal bad logins per hour.
5. Determine a threshold of logins that will alert if a brute-force attack is occurring.
