

Module 18 Day 3: Scheduling Alerts

Activity Instructions

- Now that you have determined the baselines, your manager would like you to monitor the Windows servers for brute-force attacks.
- You are tasked with designing and scheduling an alert to notify your team if a brute-force attack is occurring.

Instructions

Using the thresholds produced from the last activity, design an alert with the following criteria:

- Check if the threshold has been met every hour.
- If the threshold has been met, generate an email to `SOC_Team@ompcountry.biz`.
- Title the alert message "Brute Force Alert" and provide the SOC instructions on how to proceed.

Bonus

Another server is experiencing brute-force attacks. However, this server has a much higher volume of activity.

- Upload and analyze the `bonus_logs.txt` file, then:
 - Determine when the attack occurred.
 - Determine the baseline thresholds for alerts.
 - Create an additional alert.
