

Module 18 Day 3: Splunk Statistics

Activity Instructions

You continue to be the SOC manager at OMP.

- Your manager is concerned about the DoS attack you discovered.
- You are tasked with creating several statistical reports to illustrate details about the DoS attack.
- Additionally, you are tasked with creating a field to identify attacks against a sensitive database server's destination IP 12.130.60.5.

Instructions

1. Using the same Fortinet log file from the last activity, design SPL queries to display the following statistical reports.
 - Top 20 destination IP addresses (with count and percent)
 - Top 10 source IP addresses (with count and percent)
 - Top 10 source IP addresses/source port combination (with count and percent)
2. Using `eval`, create a field called `DB_Type` to help identify a sensitive database (12.130.60.5) that contains customer data.
 - If the destination IP is 12.130.60.5, set the `DB_Type` field to `Customer DB`.
 - If the destination IP is not 12.130.60.5, set the `DB_Type` field to `Non-Customer DB`.
3. Display the results of this field in a statistical report.
