

Module 11 Day 1: Cryptography

Solution Guide: Code Names

In this activity, you created and encrypted a code name, and decrypted your partner's code name.

The following solution uses the example code name of Blue Fox.

- For encryption, we will use a key of three to shift the letters down three in the alphabet.
- The first letter B will be shifted three letters to become E.
- The next letter l will be shifted three letters to become o.
- If we continue this pattern for each letter, the encrypted name will be Eoxh Ira.

As an example for decryption, we will use a different encrypted name, Vwhho Kdzn.

- For deciphering, we will apply the key in reverse, shifting the letters three to the left.
- The first letter V will be shifted three letters to become S.
- The next letter w will be shifted three letters to become t.
- If we continue this pattern for each letter, the decrypted name will be Steel Hawk.
