

Module 11 Day 3: Cryptography

Solution Guide: Steganography

The goal of this activity was to demonstrate how steganography is used as an applied cryptographic concept to hide a message within non-secret data, such as an image. You applied the command-line tool `steghide` to find the secret message.

- Save the image to your VM.
- Preview the image by double-clicking the image from the desktop of your VM.
 - The image should display a DeLorean car:

- Next, from the command line, go to your desktop directory to run the following `steghide` command:
 - `steghide extract -sf mydreamcar.jpg`
- When it asks for the password, enter the brand of the car:
 - `delorean`
- This extracts the hidden file, called `list_of_targets.txt`.

- Preview the contents. This clearly reveals the previous and future targets of the Alphabet Bandit:
