

Solution Guide: Creating Domain OUs, Users, and Groups

In this activity, you were tasked with creating the user accounts for the sales representative Bob and the developer Andrew, and creating the proper organizational units and groups to put them in.

Make sure you're connected to the **Windows Server machine**.

- With the **Server Manager** open, click on **Tools** at the top right.
- Select the **Active Directory Users and Computers (ADUC)** tool.

Solutions

1. Create a top-level **GC Users** organizational unit for each department's users.
 - With **ADUC** open, do the following:
 - Right-click **GOODCORP.NET**, go to **New**, then **Organizational Unit**.
 - Name this OU **GC Users**.
 - The sub-OUs in this top-level OU will hold the users for each department.
 - Right-click **GC Users**, and create a new **Organizational Unit** under it called **Sales**.
 - Right-click **GC Users**, and create a new **Organizational Unit** under it called **Development**.
 - We now have an **Organizational Unit** tree for our users, separated by department.

2. Create a user, **Bob**, in the **Sales** OU.

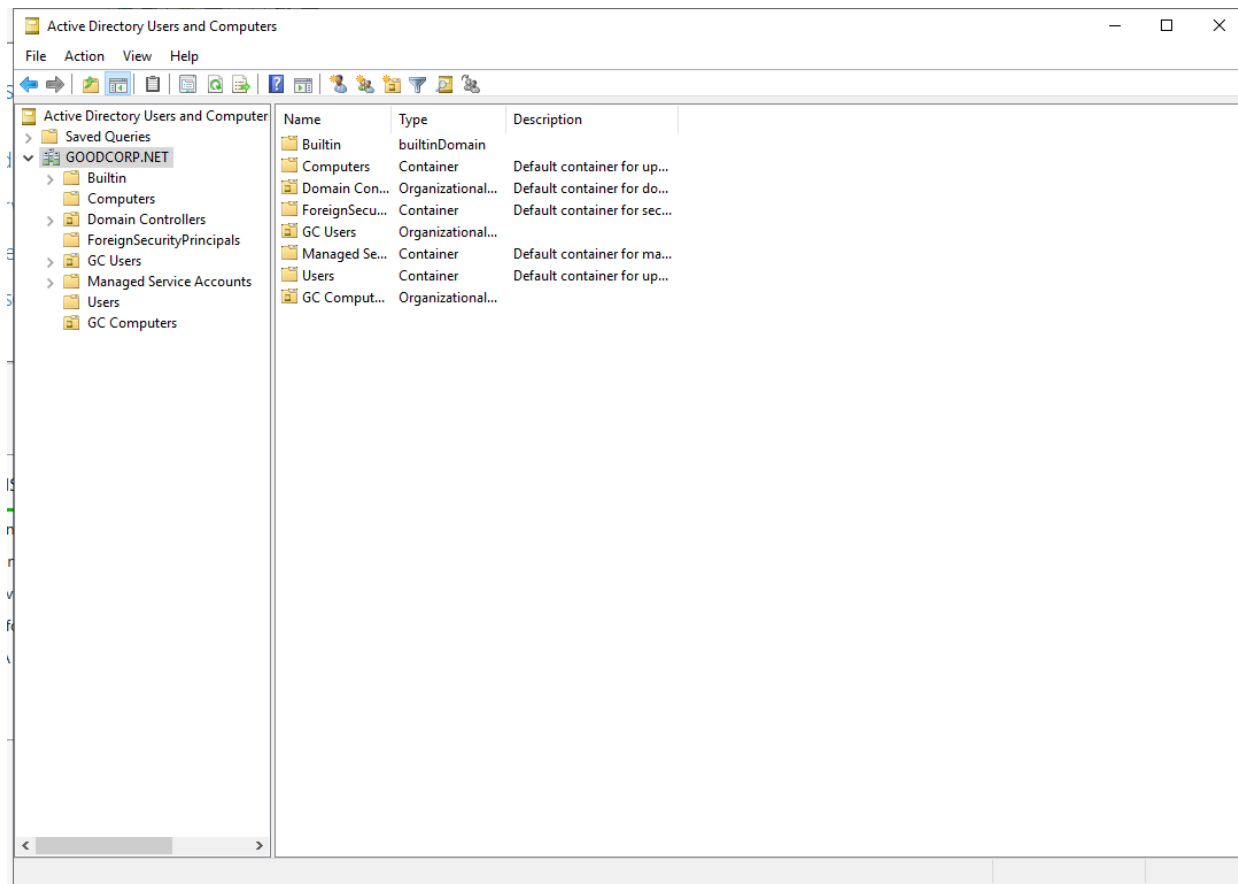

- Expand the **GC Users Organizational Unit** and right-click the **Sales** OU, then **New**, then click on **User**. A new **New Object - User** window will appear.
 - On the **New Object - User** window, type in **Bob** for the first name and the **User logon name**.
 - Click **Next >**
- The next screen will have fields for setting Bob's password and a few password settings for sysadmins to set.
 - Set the password to **Ilovesales!**.
 - Uncheck **User must change password at first logon**.
 - **Note:** In a real-world scenario, we would have Bob reset his password on his first login.
- Click **Next >**
 - The next screen shows you the settings you selected. It should have the following settings:
 - Full name: **Bob**
 - User logon name: **Bob@GOODCORP.NET**
- Click **Finish**.
- If we double-click to the **GC Users > Sales** OU (the folder icon), we can find our newly created user, **Bob**.
- Now we have a domain user account for our sales rep, Bob.

3. Create a group, **Sales**, within the **Sales** OU.

- With **ADUC** still open, right-click the **GC Users > Sales** OU, then click **New**, then **Group**.

- Set the Group name to Sales. Leave Group scope as Global and Group type as Security.
 - Click OK.
 - A new group, Sales, will appear in the GC Users > Sales OU.
 - Now we need to add Bob to Sales.
 - Right-click Bob and go to Add to a group....
 - In Select Groups, type Sales in the Enter the object names to select field.
 - Click Check Names.
 - Sales becomes underlined, meaning the system found the group.
 - Click OK. A new screen will appear saying, The Add to Group operation was successfully completed.
 - Click OK.
 - Bob is now part of the Sales group in our domain.
4. Create a user, Andrew, in the Development OU.
- To create the Development user and group, use the the same process used for Sales.
 - Repeat Step 2 with user Andrew. Set the password to Ilovedev!.
5. Create a group, Development, within the Development OU.
- Repeat Step 3 to create the group Development.
6. Move the Windows 10 machine in the existing default Computers directory to a new GC Computers OU.
- Right-click GOODCORP.NET, go to New, then Organizational Unit.

- Name this OU **GC Computers**.
- Drag the Windows 10 VM in the existing default **Computers** directory to the new **GC Computers** OU.
- It should be on the same level as **GC Users**, as shown in the following screenshot:
