

Module 11 Day 3: Cryptography

Activity File: Hashcat

You will continue your role as a security analyst working for the Hill Valley Police Department.

- You impressed Captain Strickland by logging into Detective Tannen's account. Unfortunately, the file you must access to prove Tannen is the Alphabet Bandit is encrypted on their computer.
- Fortunately, you found a hash on Detective Tannen's computer that will likely lead you to the password for opening the encrypted file:
f31663d6c912b0b1ced885a6c6bbab7c.
- Your task is to use Hashcat to figure out the plaintext representation of the hash.
- Once you figure out the password, you will open the secret file and see if it contains the evidence needed to convict the Alphabet Bandit.

Instructions

- [Secret.zip](#)
1. Use Hashcat to determine the plaintext value of the hash found on Detective Tannen's computer.
 - The hash found on Detective Tannen's computer is
f31663d6c912b0b1ced885a6c6bbab7c.
Hint: The hashing algorithm was created in 1992 by Ronald Rivest.
 2. With the plaintext password, open the encrypted file with the command `unzip secret.zip` and confirm whether it contains the evidence needed to lock up the Alphabet Bandit.
