

Module 12 Day 3: 09 Threat Hunting - Cyber Threat Intelligence

In this activity, you will continue in your role as an SOC analyst for the California DMV.

- The SOC has succeeded in detecting alerts since system launch. As a result, your CISO has advocated for additional funding.
- Now that you're more experienced using the NSM system, you've realized that you must detect threats before they cause significant damage.
- You've decided to move from traditional network-based IDS engines, such as Snort, to a more all-encompassing ESM that includes endpoint telemetry. This involves the deployment of endpoint collection agents in the form of a host-based IDS system using OSSEC.
- You've decided to include threat hunting as part of your defense strategy. You assembled a team of highly motivated security professionals to help you.
- In this activity, you will strengthen your knowledge of concepts related to intelligence gathering and incidence response as part of the ESM process. You can use any tool you've learned to hunt for any malicious threat.

Instructions

Choose a threat and use the following threat intelligence card template to document your findings:

- [Threat Intelligence Card](#)

Sample Threat Intelligence Report

If necessary, refer to the following sample report for guidance:

1. What indicator of attack did you use to begin your investigation?
2. What was the adversarial motivation (purpose of attack)?
3. What were the adversary's tactics, techniques, and procedures?

TTP	Examples of Cyber Kill Chain penetration
Reconnaissance	The threat actor utilized online resources such as Facebook, DNS registration websites, and the "About" page of the company website.
Weaponization	The creation of a Remote Access Trojan or RAT Downloader
Delivery	A breached corporate email account
Exploitation	Crusher.exe is an executable hidden inside of a .pdf document that establishes persistence by modifying Windows registry key C:\ Windows\System32\config under the names SAM, SECURITY, SOFTWARE and SYSTEM .
Installation	A user who clicks on the email attachment.
Command & Control (C2)	A command channel tunnels through Internet Relay Chat (IRC) establishing a connection to the attacker's server
Actions on Objectives	Attacker exfiltrates private user account information

4. What are your recommended mitigation strategies?
